DISCLAIMER

IES publications are developed through the consensus standards development process approved by the American National Standards Institute. This process brings together volunteers representing varied viewpoints and interests to achieve consensus on lighting recommendations. While the IES administers the process and establishes policies and procedures to promote fairness in the development of consensus, it makes no guaranty or warranty as to the accuracy or completeness of any information published herein.

The IES disclaims liability for any injury to persons or property or other damages of any nature whatsoever, whether special, indirect, consequential or compensatory, directly or indirectly resulting from the publication, use of, or reliance on this document.

In issuing and making this document available, the IES is not undertaking to render professional or other services for or on behalf of any person or entity. Nor is the IES undertaking to perform any duty owed by any person or entity to someone else. Anyone using this document should rely on his or her own independent judgment or, as appropriate, seek the advice of a competent professional in determining the exercise of reasonable care in any given circumstances.

The IES has no power, nor does it undertake, to police or enforce compliance with the contents of this document. Nor does the IES list, certify, test or inspect products, designs, or installations for compliance with this document. Any certification or statement of compliance with the requirements of this document shall not be attributable to the IES and is solely the responsibility of the certifier or maker of the statement.

AMERICAN NATIONAL STANDARD

Approval of an American National Standard requires verification by ANSI that the requirements for due process, consensus, and other criteria have been met by the standards developer.

Consensus is established when, in the judgment of the ANSI Board of Standards Review, substantial agreement has been reached by directly and materially affected interests. Substantial agreement means much more than a simple majority, but not necessarily unanimity. Consensus requires that all views and objections be considered, and that a concerted effort be made toward their resolution.

The use of American National Standards is completely voluntary; their existence does not in any respect preclude anyone, whether that person has approved the standards or not, from manufacturing, marketing, purchasing, or using products, processes, or procedures not conforming to the standards.

The American National Standards Institute does not develop standards and will in no circumstances give an interpretation to any American National Standard. Moreover, no person shall have the right or authority to issue and interpretation of an American National Standard in the name of the American National Standards Institute. Requests for interpretations should be addressed to the secretariat or sponsor whose name appears on the title page of this standard.

CAUTION NOTICE: This American National Standard may be revised at any time. The procedures of the American National Standards Institute require that action be taken to reaffirm, revise, or withdraw this standard no later than five years from the date of approval. Purchasers of American National Standards may receive current information on all standards by calling or writing the American National Standards Institute.

1.0 INTRODUCTION

This update of ANSI/IES RP-28-07 American National Standard for Lighting and the Visual Environment for Senior Living includes major additions centered on the aging population and those with low vision. Seniors represent the fastest growing segment of the population with over 40 million Americans over 65.\(^1\) With over 10,000 Baby Boomers turning 65 everyday, ANSI/IES RP-28-07 has been expanded to include areas beyond housing and senior care facilities. New areas of interest are offices, hospitality, healthcare, commercial and places of assembly. The over 40 population represents approximately 89 million people and of those 63 percent have vision problems.\(^2\) However, there is a prevalence of low vision in the general senior population which increases dramatically after the age of 70 (Figure 1).

Figure 1: 2010 U.S. Age-Specific Prevalence Rates for Low Vision by Age, and Race/Ethnicity
(NEI [National Eye Institute] Low Vision 2010)

Low Vision is defined as vision impairment that is worse than 20/60 in the better eye, which cannot be correctable medically, surgically or with conventional eye glasses.\(^3\) People rely on a supportive visual environment to maximize their independence and safety. Whereas people with mobility impairments are easily identified by their use of assistive devices, i.e., wheelchairs, canes or walkers, persons with low vision do not typically use assistive devices or trailing techniques. Sensory loss is common to the aging process; however, perception problems are not easily recognized by others.

As the work force ages the need for lighting guidance becomes more of a concern. It seems clear that the Baby Boomer generation (born in the years 1946 through 1964) will see aging very differently from their parents. They will take their current life styles and modify them slightly but will expect to continue contributing to society and be visible in day-to-day life. This group will represent more than one in four Americans.

Also note that according to the World Health Organization, the entire world, with a few exceptions, is aging, and governments are not prepared for the growth of seniors or how to care for them. A brief search of several industrialized countries determined that there are few regulations addressing senior vision and lighting needs and prior editions of ANSI/IES RP-28-16 have been reported to be the document of choice by designers when seeking guidance in how to provide adequate light in senior communities.

The IES Lighting for the Aged and Partially Sighted Committee has worked to make this current Recommended Practice document inclusive of current research and design practice for the above population to help them maintain a quality of life into their third age. Loss of independence has been identified as the greatest fear of aging, so today’s senior will be looking for answers to maximize their aging vision.

Current codes and standards are based on the needs of younger people. Steps have already been taken to begin the transition to recognizing the needs of older people. Of major importance to achieving higher lighting levels while still complying with energy restraints is the adoption of ASHRAE/IES 90.1-2013. Work by this committee’s members along with the ANSI/ASHRAE/IES Lighting Sub-Committee has succeeded in getting the lighting levels described in Table 1 adopted as an accepted compliance method for licensed senior living communities. This acknowledgement that senior populations have a high incidence of vision impairment and therefore require higher lighting levels was achieved by extensive investigations of 10 senior living environments. This research showed that the lighting levels in ANSI/IES RP-28-07 are being followed in the test buildings and that a higher lighting power density (LPD) was justified to meet the needs of those with vision impairment.

It should be recognized that the Americans with Disabilities Act 2010 (ADA) and the Architectural Barriers Act inadequately accommodate the needs of people who are blind and those with low vision. The ADA includes Braille, but people who develop low vision later in life may not know Braille. This document is intended to increase the designers’ understanding of age-related vision loss and the importance of their design decisions that could impact the safety and independence of this growing sector of the population.

This edition has a new section devoted to Light for Human Health (Section 6), including vitamin D synthesis and circadian rhythm. Recent research\(^3\)
